PROFESSIONAL SUMMARY

7 years across backend and full-stack engineering in Node.js, TypeScript, Java/Spring Boot, and GraphQL (Apollo Federation). Built platform-standard GraphQL tooling adopted by 8+ engineering teams at American Express, including custom validation scalars and test filtering utilities on a Tier 0 system serving millions of users. Optimized API performance by 70% (800ms→240ms at BAE), delivered zero-downtime migrations on the platform, and became a top code contributor other engineers relied on for domain expertise and debugging. Fast learner who takes ownership of problems end-to-end and ships solutions without waiting to be asked.

TECHNICAL SKILLS

Languages & Frameworks: Node.js, TypeScript, JavaScript (ES6+), Java, Spring Boot, Express.js, Hapi.js, React, Redux, Python

Backend & APIs: RESTful API design, GraphQL (Apollo Federation), Microservices architecture, API Gateway patterns, Event-driven architecture, Distributed systems

Databases: PostgreSQL, MySQL, MongoDB, SQL, Query performance tuning, Data modeling, Prisma ORM

Testing: Jest, JUnit, Test-Driven Development (TDD), Integration testing, Unit testing, Snapshot testing, Code reviews, Selenium

CI/CD & DevOps: GitHub Actions, Jenkins, Git/GitHub, Docker, Automated deployment pipelines

Security: OAuth 2.0, JWT authentication, API security best practices, Input validation, Secure coding

Monitoring & Tools: Splunk (log aggregation, monitoring, alerting), OpenAPI/Swagger, Postman, Agile/Scrum

SIDE PROJECTS

FitCheck — AI-powered clothing fit predictor using React Native, Node.js/TypeScript, Python/FastAPI, PostgreSQL, and OCR (Tesseract + OpenAI Vision API) for size chart analysis with a machine learning feedback loop for personalized recommendations.

PROFESSIONAL EXPERIENCE

American Express | *Software Engineer*

New York, NY | Aug 2022 – Jan 2026

Tier 0 GraphQL platform serving 8+ channels and millions of users | Node.js, TypeScript, Java, Spring Boot, GraphQL, Apollo Federation, PostgreSQL

- Designed and implemented ISO 3166-1 country/subdivision validation as a custom GraphQL scalar after discovering that customer address mutations accepted invalid country codes with zero validation. Pushed back against senior engineer recommendation to defer ownership to other layers, built validation from scratch on an ES5 codebase where no approved library existed, and delivered a reusable scalar adopted as platform standard across all federated subgraphs, directly supporting international KYC expansion into India, France, and the UK
- Engineered a Java/Spring Boot snapshot test filtering utility using Jackson for recursive schema traversal, enabling teams to configure excluded fields via wildcard and path-based syntax so regression test coverage accurately reflected resolved data while patches were in progress, improving test reliability across 8+ microservices teams
- Designed and implemented automated end-to-end regression and UI verification suites utilizing Java and Selenium WebDriver, establishing robust test automation standards across mission-critical financial applications.
- Contributed as top-3 code contributor to the migration of a Node.js/TypeScript GraphQL monolith to Java/Spring Boot federated microservices across customer and issuance domains, retiring legacy code while maintaining zero downtime and preserving critical business logic
- Identified and resolved a federation migration defect where mutations succeeded but queries returned null due to incorrect GraphQL type mappings between subgraphs, preventing the issue from propagating across the entire federated platform

- Refactored GraphQL resolvers and mutations for improved readability and alignment with customer-first data access patterns during account-to-customer architecture transition, collaborating with Product, SRE, and Architecture teams on E3 production releases
- Served as go-to domain expert for 4 engineers on GraphQL query optimization, Node.js debugging patterns, and subgraph architecture, building shared Postman tooling and Slack documentation to accelerate team onboarding and reduce dependency on tribal knowledge

BAE Systems | *Full Stack Developer*

New York, NY | Jul 2021 – Aug 2022

Military job application portal (1M+ users) | Node.js, Hapi.js, Express.js, PostgreSQL, TypeScript, React, Redux, Swagger

- Assumed full ownership of backend APIs two weeks into the role after senior engineer departure, ramping up on an unfamiliar codebase (Hapi.js) while simultaneously stabilizing services and delivering features for a military job portal handling resume uploads, government clearance verification, and candidate matching for 1M+ service members
- Optimized API performance by 70% (avg. 800ms to 240ms) by identifying N+1 query patterns in PostgreSQL calls for candidate status lookups, implementing batch queries and refactoring Express.js route handlers to reduce redundant database round-trips across authentication and document verification endpoints
- Documented all API endpoints using Swagger/OpenAPI, built authentication flows for secure document upload and clearance status verification, and improved system reliability through comprehensive error handling that reduced production incidents and support tickets

Wells Fargo | *Software Engineer Associate*

New York, NY | Jul 2020 – Jul 2021

Batch processing systems | Java, Spring Batch, DB2, COBOL, Microservices

- Contributed to COBOL to Java microservices migration for batch processing systems handling 1M+ accounts and 500K+ daily transactions
- Created internal documentation and onboarding tooling that reduced new-hire ramp-up time and eliminated knowledge silos across the engineering team

Strong Arm Technologies | *Software Engineer Intern*

Brooklyn, NY | Jan 2020 – Jun 2020

IoT posture-tracking system (Walmart partnership) | Python, SQLAlchemy, Docker, Pytest

- Built Python/SQLAlchemy backend for posture-tracking dashboard serving 50+ managers overseeing 10,000+ industrial workers, reducing manual reporting overhead
- Implemented CI/CD pipelines with Docker and Pytest reducing deployment time by 60% and QA overhead by 35%
- Designed RESTful APIs for IoT sensor data ingestion, processing real-time posture analytics for enterprise clients

ABH Pharma | *Contract Web Developer*

Brentwood, NY | Jan 2019 – Jun 2019

MERN stack data management | MongoDB, Express.js, React, Node.js, Heroku

- Built full-stack MERN application replacing shared Excel workflows for 20+ employees, centralizing supplement inventory data and eliminating version control issues
- Engineered data processing pipeline converting Excel to JSON stored in MongoDB, eliminating manual data entry errors and deploying to production on Heroku

EDUCATION

B.S. in Computer Science | *Magna Cum Laude*

City University of New York, Lehman College
